

Internal software for European operations teams.

We replace the spreadsheets and email chains that run real processes — approvals, records, quoting, scheduling — with systems built around how the business actually works.

EU entity

EU hosting

Live 14:00–18:00 CET

Operations software

Approvals, records, scheduling

AI workflows

EU-hosted, documented

SaaS foundations

Multi-tenant, billing, roles

Cloud & reliability

CI/CD, monitoring, uptime

A 22-tonne load went to the wrong city, and nobody could prove who approved it.

Two depots, one shared file, two people editing at once. The approval cell said “**M.V. ✓**” — the operations director's initials. She had not approved it, and there was no way to show that.

€4,100

cost of one
Monday morning

6 hrs

to reconstruct
what happened

0

records of who
changed what

SHIFT LEAD · 09:14

The Antwerp load — it's on the sheet as Rotterdam. I think someone overwrote row 3 while I had it open.

OPERATIONS DIRECTOR · 09:21

Who approved it?

SHIFT LEAD · 09:22

The cell says “**M.V. ✓**”. That's you. Was it you?

OPERATIONS DIRECTOR · 09:26

No. And there's no way for me to prove it wasn't.

That was one company. It is not an unusual one.

If two or more of these are true, the process has outgrown the tool that runs it — and that is the point at which building something becomes cheaper than continuing.

01

One person understands it

A spreadsheet, an inbox rule or a macro that only one colleague can explain. It works until they are on holiday, and it becomes a risk the day they resign.

YOU WOULD RECOGNISE

- “Ask Anja, she knows how that sheet works”
- A file with a version number and the word FINAL in it
- Nobody edits it while that person is away

What it costs you: key-person risk, and a process nobody else can safely change.

02

You cannot answer “who approved this?”

No audit trail, no version history, no timestamps. When something goes wrong the answer lives in an email thread, if it exists at all.

YOU WOULD RECOGNISE

- Initials typed into a cell as a signature
- Screenshots kept “just in case”
- An hour spent searching a mailbox for proof

What it costs you: hours of reconstruction, and a problem in any customer or ISO audit.

03

The same data is typed in twice

Re-keyed from a PDF into a sheet, then from the sheet into the ERP. Every copy is a chance to introduce an error nobody catches until a customer does.

YOU WOULD RECOGNISE

- Someone reading numbers aloud off a screen
- A monthly reconciliation that exists to catch typos
- Two systems that disagree, and a person who arbitrates

What it costs you: paid hours on data entry, plus the errors that follow it downstream.

NEXARROW OÜ

An Estonian software company that builds the unglamorous systems properly.

Small, EU-registered, engineers in India, and live inside the European working afternoon. We take one process at a time and build it completely, rather than four of them to eighty per cent.

That makes us the wrong choice for anyone who needs a team of thirty — and a reasonable one for a company that wants a narrow system built well by people who answer their own email.

WHO YOU DEAL WITH

The people who scope the work are the people who build it. No account manager in between.

HOW WE SCOPE

Fixed scope, agreed in writing, with an explicit list of what is *not* included.

WHAT YOU OWN

The code, the repository and the hosting accounts — in your name from day one.

HOW WE LEAVE

Documented handover is a deliverable. You should be able to replace us without drama.

EU entity

Nexarrow OÜ, Estonia. Registry 17521430 — verifiable in a public register in under a minute.

EU VAT

EE102992676. A standard intra-community reverse-charge invoice your finance team already knows.

EU hosting

EU region by default, a DPA under EU law, and a written note of who can access what, from where.

14:00–18:00

CET, every working day. Not “flexible” — a window you can book, written into the contract.

Four services. Most clients only need the first.

The next four slides take each one in turn: what it is, what it replaces, and what actually changes for you.

SLIDE 06

Internal operations software

Approvals, records, scheduling, quoting, field data, reporting — built around your process instead of around a template.

- Approval and sign-off flows
- Records with a real audit trail
- Scheduling and dispatch
- Quote-to-invoice handoffs

Replaces: shared spreadsheets, email approvals, WhatsApp groups holding a process together.

SLIDE 07

AI workflows, EU-hosted

Reading documents, extracting fields, drafting and retrieval — wired into a real approval path rather than sitting in a chat window.

- Read a PDF, fill the fields
- Match invoices to orders
- Summarise and route email
- Answer questions over your own documents

Replaces: manual re-typing from PDFs and email into your systems.

SLIDE 08

SaaS product foundations

For companies that sell software rather than run it: multi-tenant structure, roles, seats and billing built to survive version four.

- Tenant-aware data model
- Roles, permissions and seats
- Subscription and billing flows
- Admin and support tooling

Replaces: a prototype that cannot take a second customer without a rewrite.

SLIDE 09

Cloud & reliability

Deployment, environments, monitoring and release discipline — so a fix ships this week and somebody knows before your customer does.

- Push to deploy, EU region
- A preview URL per change
- Automated tests and rollback
- Alerting that reaches a human

Replaces: a system nobody dares deploy on a Friday.

Internal operations software

The systems that decide how quickly your business can actually move: who approves what, in what order, with what record. Almost always where we start.

TYPICALLY BUILT

- Approval and sign-off flows
- Records with a real audit trail
- Scheduling and dispatch
- Quote-to-invoice handoffs
- Field and depot data capture
- Reports people actually open

YOU WOULD WANT THIS IF

- A spreadsheet is doing a system's job
- Approvals happen by email or in person
- Nobody can say who changed what
- Two people cannot work at once
- Standard tools fit about 70%

WHAT CHANGES FOR YOU

Approvals with a clear record

all of them

Two people working at once

supported

Time to answer “who approved this?”

seconds

Manual chasing and re-checking

mostly gone

Process runs without one person

yes

The value is rarely the software itself. It is that a process which depended on one person remembering things now runs the same way whether that person is at work or on holiday — **and you can prove what happened.**

AI workflows, hosted in the EU.

Not a chatbot bolted onto the side. AI doing one defined job inside a process that already exists — reading a document, extracting the fields, and handing the result to a human who approves it.

TYPICAL JOBS

- Read supplier PDFs, fill the fields
- Match invoices to orders
- Summarise and route incoming email
- Answer questions over your own documents
- Draft replies a person then edits

HOW WE KEEP IT DEFENSIBLE

- Models and storage in an EU region
- A written accuracy baseline before launch
- A human approves anything that matters
- Every output traceable to its source
- Documentation for your AI Act file

THE DIFFERENCE THAT MATTERS

Most AI pilots stall because nobody can say what happens to the data or how accurate the thing is. We answer both in writing before it goes live — which is usually the reason ours reach production and the pilot did not.

WHAT CHANGES FOR YOU

Data typed in twice	once, automatically
Where the data sits	EU region, documented
Accuracy	measured, not assumed
Who decides	still a person
AI Act paperwork	written as we build

SaaS product foundations

For companies whose product *is* the software. The structural work that decides whether adding your tenth customer is a configuration change or a rewrite.

WHAT WE BUILD

- Tenant-aware data model
- Roles, permissions and seats
- Subscription and billing flows
- Admin and support tooling
- Dashboards customers rely on

YOU WOULD WANT THIS IF

- A prototype won a real customer
- Each new client needs custom work
- Billing is done by hand
- One customer's data worries you
- A second developer cannot read it

WHAT CHANGES FOR YOU

Onboarding a new customer	configuration, not code
Billing	automatic and auditable
Tenant data separation	enforced in the model
Handing work to a new dev	possible
Security questionnaires	answerable

The honest framing: this work is invisible to your customers and obvious to your engineers. It is what stops your roadmap slowing down every quarter — **and it is far cheaper before the tenth customer than after.**

Cloud & reliability

Included in everything we build, and available on its own for systems somebody else built. It is the difference between software you can change safely and software everyone is slightly afraid of.

Deploy

Push to deploy, EU region by default, a preview URL for every change so you can see it before it is live.

Test

Automated checks on every change, and a rollback that takes minutes rather than an evening.

Watch

Uptime and error alerting that reaches a human — quiet enough that people still trust it at 3 a.m.

Prove

Logs, access records and retention set up so an audit is a conversation rather than a project.

WHY THIS IS ON A SLIDE AT ALL

Most “the software is slow to change” problems are not code problems. They are deployment problems.

When a small change takes three weeks, it is usually because nobody is confident it can be released safely. Fixing that once changes the speed of everything afterwards — including the parts of the system we did not build.

What actually changes, in the language of the business.

Nobody buys software. They buy fewer hours on admin, fewer errors reaching customers, and the ability to answer a question in four seconds instead of six hours.

Hours a week on manual admin

from double figures to a couple

down

Errors reaching a customer or invoice

fewer hand-offs, fewer copies

down

Time to answer an audit question

instant, from a record rather than a memory

down

Ability to work in parallel

two depots, two shifts, one system

up

Dependence on one person

the process outlives the person who built it

Direction and relative scale, not a promise of a specific figure — the diagnostic measures your actual numbers before anything is built.

down

Time

Hours returned to the people who were doing it manually

Accuracy

Fewer errors reaching a customer or an invoice

Evidence

Who did what, when — available instantly, not reconstructed

Resilience

The process survives holidays, illness and resignations

The four questions that usually delay a supplier decision by weeks.

In our experience these are what actually hold up a software decision in a European company — not price and not technology. We answer all four in the first email, before anyone has to ask.

You are welcome to send this slide to whoever handles your contracts. It is the version we would give them anyway.

QUESTION 01

Which entity, and where?

Nexarrow OÜ, Estonia. Registry 17521430 — a public register you can check yourself.

QUESTION 02

How does the invoice work?

VAT EE102992676. A standard intra-EU reverse-charge invoice. Sample available before you sign.

QUESTION 03

Where does our data sit?

EU region by default. DPA and sub-processor list on request. Our engineers are in India and that access is documented, not hidden.

QUESTION 04

When are you available?

14:00–18:00 CET, Monday to Friday, in the contract. You can only book a slot we are genuinely awake for.

Six weeks, and you can open it in week two.

A typical first build. The shape matters more than the dates: something real, early, in front of the people who will use it.

WEEK 01

Understand

Interviews with the people who do the work. Scope agreed in writing.

WEEK 02

You can click it

A working version on a URL — incomplete, real, and open to complaints.

WEEK 03

The hard part

The logic that made standard tools a bad fit in the first place.

WEEK 04

Roles and edges

Permissions, error states, the cases nobody mentioned in week one.

WEEK 05

Real data

Your actual records migrated and tested, not sample data.

WEEK 06

Handover

Deployed, documented, trained. The old process gets a retirement date.

WHAT YOU GET

- Fixed scope agreed in writing before we start
- Code and accounts in your own name, from day one
- A written architecture note in plain language
- Documented handover as a deliverable, not a favour

WHAT WE NEED FROM YOU

- One person who can make decisions
- Two to four hours a week from the team
- Access to the people who do the work
- Real data, not sanitised samples

WHAT WE WILL TELL YOU

- When a request is about to become expensive
- When something went wrong that week
- When you should buy software instead of building it
- When we are the wrong firm for the job

Your afternoon is our evening.

The usual assumption about a team in India is overnight replies and calls at awkward hours. The opposite is true here, and it is the only availability claim we make.

4 hours

of genuine overlap, every working day

Same day

questions answered inside your shift, not overnight

Monday–Friday

not weekly, not “whenever suits”

In writing

stated in the contract, not just on a slide

It starts small, on purpose.

Three steps, and stopping after the first is a perfectly good outcome. Fees are fixed and quoted per engagement — we would rather scope it properly than put a number on a slide that does not know your process yet.

STEP ONE

01

Operations Diagnostic

One week · fixed fee · mostly asynchronous

- Two interviews in your afternoon
- A written map of the process as it runs today
- What is worth building, ranked, with what it saves
- A costed recommendation you can act on
- An explicit list of what we would *not* build
- The one metric we would measure afterwards

You keep the report either way — and the fee is credited in full against a build that starts soon after.

STEP TWO

02

One workflow, built

Typically five to eight weeks · fixed scope · milestone-billed

- One process, end to end and in daily use
- Roles, permissions and an audit trail
- Integrations with the systems you already run
- EU deployment, documentation and handover
- A working version you can click in week two
- Training for the people who will use it

Scope and price are agreed before anything is built, from what the diagnostic found.

STEP THREE

03

Keep it alive

Monthly · capped hours · three-month minimum

- A fixed monthly hour bank for changes
- A named engineer who knows your system
- EU-afternoon availability maintained
- A written monthly report, generated not typed
- Uptime and error alerting kept running
- Unused hours roll one month before expiring

Optional. Some clients take the handover and run it themselves — which is a fair outcome and the reason we document properly.

We are a good fit for some of this, and a bad one for the rest.

Worth establishing early. A supplier who claims to suit every project is telling you something about how they scope.

✓

A GOOD FIT

Company size	25–250 people
The problem	One process, clearly painful
Who decides	One person, not a committee
Internal IT team	Small or none
What matters most	Reliability and clarity
Timezone	Anywhere in Europe

✕

NOT A GOOD FIT

You need a team of thirty	we are small on purpose
You need cover all day	we are live four hours
Scope is “an app like Uber”	no brief, no estimate
Decision by committee	the project will stall
Safety-critical or high-risk AI	not our competence
Cheapest bid wins	we will not be it

If your project sits in the right-hand column, we will say so on the first call rather than in month three.

We would rather lose a badly-fitting project early than deliver it badly and lose the reference. It is also the fastest way for you to find out whether to keep looking.

Show us the process that keeps breaking.

The spreadsheet, the approval chain, the thing that needs one person to hold it together. Two conversations in your afternoon, and we will tell you what it would take to fix — and whether it is worth fixing at all.

If the answer is no, that is a useful afternoon for both of us.

ONE WEEK

FIXED FEE, CREDITED AGAINST A BUILD

YOU KEEP THE REPORT

HOW TO REACH US

Email	hello@nexarrow.eu
Web	nexarrow.eu
Company	Nexarrow OÜ
Registry · VAT	17521430 · EE102992676
Based	Tallinn, Estonia
Live hours	14:00–18:00 CET

Send the four questions from slide 11 and we will answer all of them in one email, before you have to chase.
